

DAKSH MEHTA

East Lansing, MI | (517) 980-3945 | mehtadak@msu.edu | [LinkedIn](#) | [Portfolio](#)

SUMMARY

Software Engineer graduating May 2026 with experience delivering client facing technical solutions and production grade data systems. Skilled at translating complex technical requirements into working implementations, collaborating across cross functional teams, and iterating rapidly on client feedback. Proficient in Python, SQL, cloud APIs, LLM orchestration (RAG) and Unity engine simulations.

EDUCATION

Michigan State University, College of Engineering

May 2026

B.S. Computer Science, Minor in Game Development | GPA: 3.81

Relevant Coursework: Data Structures & Algorithms, Senior Capstone, Agentic AI, Database Management

EXPERIENCE

NetJets – CS Capstone | *Simulation & Backend Developer*

Jan 2026 – May 2026

Unity, C#, SQLite

- Served as a technical liaison with NetJets stakeholders, gathering client specified safety requirements, translating them into simulation features, and iterating on designs based on structured playtest feedback to meet enterprise training objectives.
- Led a cross-functional team of six developers across a full delivery cycle: coordinating tasks, managing milestones, and communicating progress. Successfully delivered Alpha and Beta builds on strict client deadlines.
- Designed and implemented client specified failure mode scenarios modelling real world airport hazards (ground vehicle collisions, wingwalker positioning errors), enabling the simulation to accurately assess trainee safety compliance.
- Built a local authentication and score tracking system via SQLite schema design and Unity C# integration, enabling persistent user session management and performance tracking across training sessions.

i-Customer | *Data Engineer Intern*

May 2025 – August 2025

Python (Pandas, NumPy, Selenium, Pyppeteer), PostgreSQL, HubSpot API, Airbyte

- Designed and implemented automated ETL pipelines ingesting data from HubSpot APIs and web sources into PostgreSQL via Airbyte, eliminating manual data ingestion and improving downstream analytics reliability.
- Processed and normalized large-scale datasets (17M+ rows) through optimized Python scripts for API ingestion, web scraping, and data cleaning, enabling accurate reporting and business intelligence.
- Built a company enrichment scraping tool using Selenium and Pyppeteer to collect missing business metadata at scale, significantly improving data completeness for analytics and sales teams.
- Collaborated with mentors and managers to identify data quality gaps, prioritize pipeline requirements, and deliver solutions that directly improved CRM data accuracy for go to market teams.

PROJECTS

Full-Stack AI Project | *Agentic AI Web Application*

Fall 2025

Python, Flask, PostgreSQL (pgvector), JavaScript, Docker, OpenAI API, Socket.IO

- Developed a full-stack AI-native web application implementing a multi-agent conversational system with OpenAI GPT models, semantic search via pgvector embeddings, and context-aware database queries.
- Designed real-time human-in-the-loop safety mechanisms using Flask sessions and Socket.IO, requiring user approval for high-risk automated database operations — demonstrating production-grade reliability thinking.

Grocery Store Backend | *Backend Application for a Grocery Store Inventory Management*

Spring 2025

Python, SQLite, Flask, Docker

- Developed a containerized microservices architecture using Flask, SQLite, and Docker to simulate a full backend system for a grocery store, with isolated services for users, products, orders, search and logging.
- Implemented secure user authentication and authorization using JWTs, with role based access control and inter service communication to enforce permissions across all endpoints.
- Designed and integrated RESTful APIs for service interactions, supported real time logging, product search, and order processing, ensuring modularity and fault isolation through a custom Docker network.

Sparty's Boots Game Development | *C++ Circuit Logic Game*

Fall 2024

C++, wxWidgets

- Developed an interactive logic based game where players build circuits using logic gates to control a robot and manage conveyor belt operations, incorporating dynamic visual feedback for active circuit elements.
- Collaborated with a team using Trello for task management and Agile methodologies and Git for version control.

TECHNICAL SKILLS

Languages: Python, SQL, C++, C#, JavaScript, HTML/CSS

Frameworks & Libraries: Flask, Pandas, NumPy, Selenium, Pyppeteer, Socket.IO, wxWidgets, OpenGL

Data & Databases: PostgreSQL (pgvector), SQLite, Airbyte, ETL pipeline design

AI / ML: LLM orchestration (RAG), OpenAI API, vector embeddings

Tools & Platforms: Unity, Git, GitHub, Docker, Linux, GCP
